INNOVATIVE ASSIGNMENT

SVM USING MAPPER AND REDUCER

Some Machine Learning problems are just too big to run on one machine, sometimes maybe you just have such a large amount of data, (for instance you have 100 million training examples) that you would not want to run all that through a single computer, irrespective of what algorithm you are using. To combat this problem, a different approach to large scale Machine Learning known as the "Map-Reduce" approach, was developed by Jeffrey Dean and Sanjay Ghemawat. With the idea of Map-Reduce we would be able to scale learning algorithms to large machine learning problems, much larger than is possible with Batch Gradient Descent.

In Map-Reduce we split the training set into a convenient number of subsets. Each of these subsets serve as an input for n different machines. Each of these machines will now run the Batch Gradient

Descent learning rule for their respective subset of data.

ALGORITHM

The **main algorithm** can basically be broken down into 4 steps:

- 1. Basic setup and initialization of the weights and biases
- 2. Map the class labels from $\{0, 1\}$ to $\{-1, 1\}$
- 3. Perform gradient descent for n iterations, which involves the computation of the

gradients and updating the weights and biases accordingly.

4. Make the final prediction

Objective function

$$\mathcal{J}(w,b) = \lambda_{\frac{1}{2}}^{1} ||w||^{2} + \frac{1}{n} \sum_{i=1}^{n} \max(0, 1 - y_{i}(w \cdot x_{i} + b))$$

Mapper: Computing the gradients
